

Suffering with hair loss? New PRP treatments can help!

BY GREICE MURPHY,
CEO of Miami Stem Cell®

Premature hair loss may cause a decrease in self-esteem and self-confidence. Consequently, there is a growing interest in innovative technology and science that helps not only to prevent excessive hair loss, but also regenerates healthy hair follicles and restores hair growth.

In the past, the only limited options for hair loss prevention have been mostly the use of topical products, such as Rogaine or Minoxidil and even the use of a low-level laser light shown to stimulate hair follicles. However, at Miami Stem Cell we have new and exciting options to treat baldness using the patient's own PRP (Platelet Rich Plasma). This amazing treatment uses the body's own natural power to self-repair, restore and regenerate aging tissues, tissue damage, as well as a myriad of other disorders, including hair loss related conditions and even alopecia.

Over the last decade, we have treated thousands of patients at our Miami institute, validating several published clinical studies indicating that using PRP, can help restore hair follicles, prevent hair loss, and promote hair growth by significantly increasing the body's own regenerative potential. PRP has expanded greatly over the past few years, not only in treating many diseases but also to restore proper hair growth.

Not all PRPs are the same and you should look for a clinic that validates the potency of its PRP. For therapeutic benefit, a dose of over 1 billion platelets per mL is required i.e., the PRP is concentrated 7x-10x higher compared to whole blood.

PRP is a three-step medical treatment in which a person's blood

is drawn, concentrated, and then injected into the scalp. The injections trigger natural hair growth and maintain it by increasing blood supply to the hair follicle and increasing the thickness of the hair shaft. The process is meticulous, with injections beginning across the scalp, approximately at every half inch over the area of thinning hair and typically, the entire procedure takes less than an hour to complete and local anesthesia is administered.

Ultimately, when compared to other more traditional hair loss

non-surgical methods, we have extensive proof that validates the fact our medical grade PRP treatments provide tremendous results to help both men and women concerned about preventing future hair loss and restoring proper hair growth. PRP is particularly effective at treating male pattern baldness, both by preventing hair loss and by promoting new hair growth, while it can also aid in the stimulation of hair growth even after hair transplants. We recommend having a series of three-to-five sessions done to get the most out of the procedure, with annual maintenance treatments thereafter to maintain the results, but even one visit can make a difference.

In conclusion, hair loss can now be optional. If you are starting to see the signs of hair loss or the beginning of baldness, this is the ideal time to get started with our state-of-the-art PRP treatment - the key is to prevent further hair loss - rather than try to go back and fix the problem after the fact.

Schedule a free in-person or virtual consultation today with one of our experts and take advantage of our FREE financing options.
